Abstract of JP2002326433

PROBLEM TO BE SOLVED: To enable printing close to the printing result intended by a user and effectively control a printing process of a printer even when a printing condition intended by the user does not agree with a set condition set to the printer.

SOLUTION: It is detected whether or not the printing condition of a priority 1 agrees with the set condition of the laser printer 1000. When the conditions disagree, information on the disagreement is informed to a host computer 3000. When the printing condition agrees with the set condition, it is judged whether or not the printing condition of a priority 2 disagrees. When the printing condition of the priority 2 disagrees, it is judged whether or not a forced action is present from the operator. When the forced action is present, the printing condition of the priority 2 is neglected and whether or not the printing condition of a priority 3 has a disagreement is judged. When the printing condition of the priority 3 includes the disagreement, the printing condition is automatically neglected and a sequence of the printing condition disagreement process (1) is terminated.
